Palm Oil Industry Introduction

Extra Dose of Vitamin A & E
From Palm Oil

$$$$$$$$$$$
Introduction of Oil Palm History

- The palm Oil (*Elaeis Guineensis*) is native to West Africa.

- Oil palms was introduced to Java by the Dutch in 1848 and to Malaysia (then the British Colony of Malaya) in 1910 by Scotsman William Sime and English banker Henry Darby.
The early oil palm plantations were established and operated by British plantation owners, such as Sime Darby & Boustead in Malaysia.

Commercial exploitation of the oil palm began in the early 1900’s in Asia; Beginning in 1910 in Sumatra and in the 1920s in what is now the country of Malaysia.
Introduction of Oil Palm History

- In the 1950’s Malaysia began to clear rainforests in an effort to weed out communist guerillas and “settle landless people.” (Palm Oil, Kurt Berger, pg 2, pp3, www.britaniafood.com)

- FELDA (Federal Land Development Agency) was formed in July 1, 1956. Malaya began to create oil palm plantation settlements for the poor in the rural area.
The large plantation companies remained listed in London until the Malaysian government engineered their “Malaysianization” throughout the 1960s & 1970s.

1979, the government set up the Palm Oil Research Institute of Malaysia (PORIM) to support development of oil palm plantation industry.

Government also set up the Palm Oil Registration and Licensing Authority (PORLA) to in charge quality and licensing.
Introduction of Oil Palm History

• PORIM and PORLA were merged and renamed as Malaysia Palm Oil Board (MPOB) in 2000, became Malaysia’s top R&D entity with the highest technology while regulating oil palm industry in Malaysia.
Today, Malaysia and Indonesia palm oil players dominate the global Palm Oil industry with combined contribution of 85% of world palm oil production.

Fact and figures of Oil Palm Industry

- **Today**... Crude Palm Oil (CPO) price reached >RM 3300/MT and the CPO price is projected will reach RM 4000/MT from the coming 3 or 4 years time.
To ensure the long term profitability and grow of the Malaysian palm oil industry.

Act as the single united voice of the Malaysian palm oil industry.

A platform for discussion on palm oil plantation issues and support its R & D.
Germinated seeds are planted into their nursery for one year before transplant to the field.
Palm Oil Plantation Outlook

Palms transplanted to the field will start flowering and bear fruit after 3 years.

Palms reach the maximum yield after 6th years
Identify Healthy Palm Oil Tree

This palm cannot survive and grow into a productive palm. First slash the grass.

This yellow palm on grassland is due to severe nutrient deficiency.
Identify Healthy Palm Oil Tree

This seedling will not bear fruit for many years.

This seedling will bear fruit two years after planting if properly taken cared of.
Identify Healthy Palm Oil Tree

Immature palm with weeds around the palm due to lack of weeding.

Immature palm with a clean weeded circle.
Identify Healthy Palm Oil Tree

A nitrogen deficient palm has an open canopy, short light green fronds and low yield.

A nitrogen sufficient palm has dense canopy, long dark green fronds and high yield.
Identify Healthy Palm Oil Tree

Ganoderma infected palms have hanging fonds.

Ganoderma infected trunk must be chipped to promote rapid decay of infected material.
Good Palm Oil Plantation Design

If you have a clean weeded circle, the fertilizer you apply is used by the palms NOT by weeds. It will also make it easier to harvest and pick up loose fruit.
High Yield Palm Oil Bunches

Under-pruned young palm with too many fronds below the bunches.

Over-pruned young palm with no fronds below the ripest bunches.

Correctly pruned young palm with two fronds below the ripest bunch.
High Yield Palm Oil Fresh Fruit Bunches (FFB)
Good Harvest Palm Oil Sign

More than 100 loose fruit indicates that Harvesting round is late and the bunch should have been harvested during the previous harvest.

Four to five loose fruit in the circle indicates that the bunch is ready for harvesting.
Loose Fruits = Loss $$$

Many loose rotten fruit left in the circle means a loss of income for the grower.

Worker is collecting fruit and receiving a separate income.
Modern Palm Oil Mill
Crude Palm Oil Milling Process
1. Crude Palm Oil (CPO) – Oil produced from mesocarp (flesh) of a palm oil fruit.

2. Refined, Bleached & Deodorized (RBD) Palm Oil – Is CPO that has had been decolorized, deodorized and Free Fatty Acid removed (PFAD for Palm Fatty Acid Distillate).

3. Olein – Is the liquid portion fractionated from refined palm oil through a chilling process to a particular temperature. This is the primary source used as cooking oil.

4. Stearin – is the semi solid portion of refined palm oil after the fractionated process. This is mainly used for manufacturing margarine and confectionary shortenings.

**Free of Cholesterol and Trans Unsaturated Fatty Acids** - Palm oil, like other vegetable oils, is cholesterol free. Having a moderate level of saturation, it does not require hydrogenation for use as a fat component in foods and, as such, **does not contain trans fatty acids**.
Benefits Of Palm Oil Products

- Carotene
  - Enhance immunity and protects against toxins, colds, flu and infections
  - Prevent skin disorders, used as an oral sun protectant
  - Natural compounds in food, cosmetic and pharmaceutical
  - Responsible for reducing the harmful effects of free radicals
  - Prevent night blindness and other eye diseases
  - Anti-cancer properties for certain types of cancers

General Palm Oil Plantation Information

• 1 acre is generally planted with 55 palms.

• 1 hectare is generally planted with 135 palms.

• 1 acre of mature palm can generally produce an average 0.8 MT of fruit/month.

• 1 hectare of mature palm can generally produce an average 2 MT of fruit/month.

• 1 Metric Ton (MT) of Fresh Fruit Bunch (FFB) can generally produce 200 kg or 20% of Crude Palm Oil (CPO) and 50kg or 5% of Kernel.
1) Fresh Fruit Price is around 1/5 of CPO price
   If CPO price = RM3200
   Thus ➔ Fresh Fruit Price is around RM640

2) Cost of Fresh Fruit Bunch Production

Why the demand for Palm Oil Increasing?

- Over 85% palm oil is consumed in development world at present where rising populations and income fuelling demand base on the trend towards higher colorific (“Western style”) diets.
- WHO is concerned about trans-fatty acids in food also a key factor leading to the increment of palm oil demand.
- Demand is affected in the development world by shift towards meeting bio-fuel target 10% in EU 2012 and 20% in USA 2022.
Global Sustainable Commodity Product

Players in the Sustainable Palm Oil Supply Chain

- Oil Palm Growers
- Social or Developmental NGOs
- Palm Oil Processors or Traders
- Environmental or Nature Conservation NGOs
- Consumer Goods Manufacturers
- Banks and Investors
- Retailers
